$$\text{Sol: } \frac{dT}{T} - \frac{V}{T} dP$$

$$= \frac{1}{T} dT - \frac{V}{T} dP \quad \left(PV = RT, \frac{V}{T} = \frac{R}{P} \right)$$

$$= \frac{1}{T} dT - \frac{R}{P} dP$$

$$= M dT + N dP$$

$$M = \frac{1}{T}; N = -\frac{R}{P}$$

$$\frac{\partial M}{\partial P} = 0; \frac{\partial N}{\partial T} = 0$$

$$\text{In the air, } R = 3r$$

$$\text{Balloon volume, } V_2 = 27 \times \frac{4}{3} \pi r^3$$

Temperature constant \Rightarrow Isothermal

$$\Rightarrow \text{Process } P_1 V_1 = P_2 V_2$$

$$\Rightarrow P_2 = 72 r^3 / 27r^3 = 2.67 \text{ cm of Hg}$$

16. Ans: $P_1 > P_2$

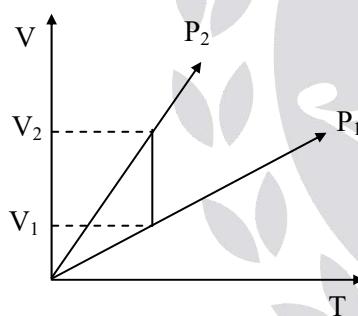

Sol: For isothermal process: $T = c$

$$\Rightarrow P_1 V_1 = P_2 V_2$$

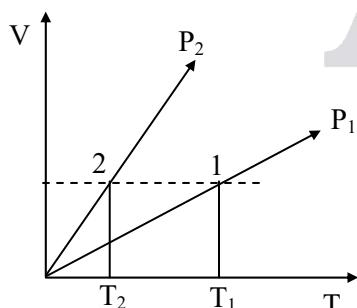

$$P_2 = P_1 \left(\frac{V_1}{V_2} \right)$$

As per fig we can say $T_1 > T_2$

$$\Rightarrow P_1 > P_2 \dots \left(\frac{V_1}{V_2} < 1 \right)$$

(2) For isochoric : $V = C$

$$t_A = 51^\circ\text{C}; t_B = 50^\circ\text{C}$$

$$0 = a + b \times 0 + c \times 0$$

$$\therefore a = 0$$

$$100 = 100b + 10^4 c \times 1$$

$$\underline{51 = 50b + 2500c \times 2}$$

$$102 = 100b + 5000c$$

$$\underline{100 = 100b + 10000c}$$

$$-5000c = 2$$

$$c = \frac{-2}{5000} = -4 \times 10^{-4}$$

$$50b + 2500c = 51$$

$$50b + 2500 \times (-4 \times 10^{-4}) = 51$$

$$50b = 51 + 1$$

$$b = \frac{52}{50} = 1.04$$

$$\therefore t_A = 1.04 t_B - 4 \times 10^{-4} t_B^2$$

$$t_B = 26^\circ\text{C}$$

$$\begin{aligned} t_A &= 1.04 \times 26 - 4 \times 10^{-4} \times 26^2 \\ &= 27.04 - 0.2704 \\ &= 26.77^\circ\text{C} \end{aligned}$$

19. Ans: 21.6°C

Sol: Given relation $t = a \ln(K) + b$

K is 1.83 at ice point $\Rightarrow t = 0^\circ\text{C}$

K is 6.78 at steam point $\Rightarrow t = 100^\circ\text{C}$

As per given relation, $t = a \ln(K) + b$

By condition 1 $\Rightarrow 0 = a \ln(1.83) + b$

$$0 = 0.60 a + b$$

By condition 2 $\Rightarrow 100 = a \ln(6.78) + b$

$$100 = a 1.914 + b \Rightarrow a = 76.10$$

$$b = -45.66$$

\Rightarrow By putting value of a & b

$$t = 76.10 \ln K - 45.66$$

$$(K = 2.42 \text{ given})$$

$$\Rightarrow t = 21.6^\circ\text{C}$$

20. Ans: $550^\circ\text{N}, -50^\circ\text{C}$

Sol: Freezing point of ice = $0^\circ\text{C} = 100^\circ\text{N}$

Boiling point = $100^\circ\text{C} = 400^\circ\text{N}$

Let new scale be given as

$$N = a t + b$$

$$100 = a (0) + b$$

$$\therefore b = 100$$

$$400 = 100 a + b$$

$$\therefore a = 3$$

when $t = 150^\circ\text{C}$

$$N = 3(150) + 100$$

$$N = 550^\circ\text{N}$$

The new scale N and Celsius will be same if

$$t = 3 t + 100$$

$$-2t = 100$$

$$\therefore t = -50^\circ\text{C}$$

Sol: The slope of log P – log V graph for a gas for isothermal change is m_1 & for adiabatic changes are m_2 if gas is diatomic gas

For isothermal process, $PV = C$

$$\log(P) = \log(C) - \log(V)$$

Chapter- 10 Rankine Cycle

01. Ans: (d)

Sol: Assertion is false and Reason is true

Steam rate or specific steam consumption

$$= \frac{1}{W_T - W_C} \frac{\text{kg}}{\text{kW sec}} = \frac{3600}{W_T - W_p} \frac{\text{kg}}{\text{kW.hr}}$$

For Carnot cycle as pump work is very high so specific steam consumption is very high.

For Carnot cycle the mean temperature heat addition is greater than Rankine cycle, so $\eta_C > \eta_R$

02. Ans: (d)

03. Ans: (d)

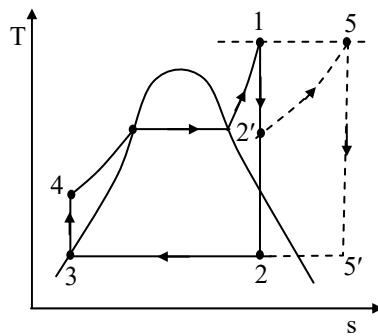

Sol: Process ABCDE is heat addition process in boiler.

04. Ans: (b)

Sol: The expansion process in turbine like 1-2 is carried out in modified Rankine cycle.

05. Ans: (c)

Sol: Due to reheating in Rankine cycle :

- (i) Work output of turbine increases as expansion is carried in two stages.

$$W(\text{without reheat}) = h_1 - h_2$$

$$W(\text{with reheat}) = (h_1 - h_2') + (h_5 - h_5')$$

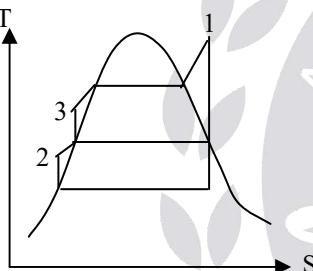

- (ii) Turbine efficiency increases as mean temperature of heat addition increases.

$$(iii) \text{ Specific steam consumption} = \frac{3600}{W_{\text{net}}}$$

As W_{net} increases so specific steam consumption decreases.

09. Ans: (b)

Sol: Advantages of multi-stage compression are

- Improved overall volumetric efficiency. If all compression were done in one cylinder the gas in the clearance volume would expand to a large volume before the new intake could begin. This results in a very low volumetric efficiency. By cooling the gas between the stages a much higher efficiency can be obtained.
- A reduction in work required per stroke, and therefore the total driving power.
- Size and strength of cylinders can be adjusted to suit volume and pressure of gas.
- Multi-cylinders give more uniform torque and better mechanical balance thus needing smaller flywheel.
