16.

Sol: At ground

$$\text{Balloon volume, } V_1 = \frac{4}{3} \pi r^3$$

$$P_1 = 72 \text{ cm of Hg.}$$

In the air, $R = 3r$

$$\text{Balloon volume, } V_2 = 27 \times \frac{4}{3} \pi r^3$$

Temperature constant \Rightarrow Isothermal

$$\Rightarrow \text{Process } P_1 V_1 = P_2 V_2$$

$$P_2 = 72 r^3 / 27 r^3 = 2.67 \text{ cm of Hg}$$

17.

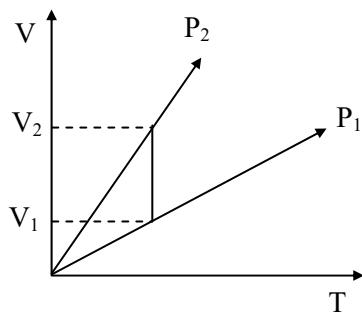

Sol: For isothermal process: $T = c$

$$\Rightarrow P_1 V_1 = P_2 V_2$$

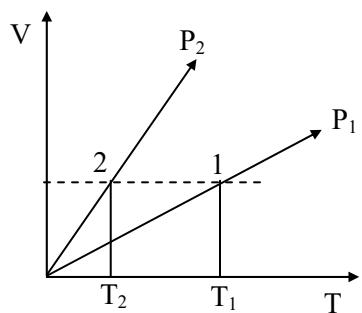

$$P_2 = P_1 \left(\frac{V_1}{V_2} \right)$$

As per fig we can say $T_1 > T_2$

$$\Rightarrow P_1 > P_2 \dots \left(\frac{V_1}{V_2} < 1 \right)$$

(2) For isochoric : $V = C$

$$\frac{P_1}{T_1} = \frac{P_2}{T_2}$$

Sol: LFP = Lower fixed point

UFP = upper fixed point

$$\frac{C - LFP}{UFP - LFP} = \frac{0 - 300}{100 - 300}$$

$$\frac{C - 0}{100 - 0} = \frac{0 - 300}{100 - 300}$$

$$C = 150^\circ\text{C}$$

19.

Sol: $t_A = a + bt_B + ct_B^2$

$$t_A = 0^\circ\text{C}; t_B = 0^\circ\text{C}$$

$$t_A = 100^\circ\text{C}; t_B = 100^\circ\text{C}$$

$$t_A = 51^\circ\text{C}; t_B = 50^\circ\text{C}$$

$$0 = a + b \times 0 + c \times 0$$

$$\therefore a = 0$$

$$100 = 100b + 10^4 c \times 1$$

$$\underline{51 = 50b + 2500c \times 2}$$

$$102 = 100b + 5000c$$

$$\underline{100 = 100b + 10000c}$$

$$-5000c = 2$$

$$c = \frac{-2}{5000} = -4 \times 10^{-4}$$

$$50b + 2500c = 51$$

$$50b + 2500 \times (-4 \times 10^{-4}) = 51$$

$$50b = 51 + 1$$

$$b = \frac{52}{50} = 1.04$$

$$\therefore t_A = 1.04 t_B - 4 \times 10^{-4} t_B^2$$

$$t_B = 26^\circ\text{C}$$

$$t_A = 1.04 \times 26 - 4 \times 10^{-4} \times 26^2$$

$$= 27.04 - 0.2704$$

$$= 26.77^\circ\text{C}$$

Unless the constructional features of thermometer are given it is difficult to say which thermometer is correct.

20.

Sol: Constant volume gas thermometer

$$V = C$$

$$t \propto P$$

$$t = aP + b$$

$$t = 0.273P - 273.22$$

$$\text{At } t = 0^\circ\text{C}, P = 1000$$

$$\text{At } t = 100^\circ\text{C}, P = 1366$$

$$0 = 1000a + b \dots\dots (1)$$

$$100 = 1366a + b \dots\dots (2)$$

By solving,

$$a = 0.273, \quad b = -273.22$$

$$t = 0.273(1074) - 273.22 = 19.9^\circ\text{C}$$

$$P = 1074 \text{ mm}$$

21.

Sol: Given relation $t = a \ln(K) + b$

$$K \text{ is } 1.83 \text{ at ice point} \Rightarrow t = 0^\circ\text{C}$$

$$K \text{ is } 6.78 \text{ at steam point} \Rightarrow t = 100^\circ\text{C}$$

$$\text{As per given relation, } t = a \ln(K) + b$$

$$\text{By condition 1} \Rightarrow 0 = a \ln(1.83) + b$$

$$0 = 0.60 a + b$$

$$\text{By condition 2} \Rightarrow 100 = a \ln(6.78) + b$$

$$100 = a 1.914 + b \Rightarrow a = 76.10$$

$$b = -45.66$$

\Rightarrow By putting value of a & b

$$t = 76.10 \ln K - 45.66$$

$$(K = 2.42 \text{ given})$$

$$\Rightarrow t = 21.6^\circ\text{C}$$

$$\log(P) = \log(C) - \log(V)$$

Compare it with $y = C + mx$

$$m_1 = -1$$

For adiabatic process

$$(dS)_{\text{Universe}} = 6.626 \text{ J/K}$$

Case - 2

Same block, $T_2 = 8^{\circ}\text{C} = 281 \text{ K}$

As it is dropped from certain height, so there is change in potential energy. Work is done by the block

Change in entropy due to work interaction = 0

$$\Rightarrow (dS)_{\text{uni}} = 2.09 \text{ J/K}$$

Case - 3

Now by joining two blocks find $(dS)_{\text{uni}}$

$T_1 = 100^{\circ}\text{C}$, $T_2 = 0^{\circ}\text{C}$

Heat lost by block -1 = Heat gained by
block -2

$$C(T_1 - T_f) = C(T_f - T_2)$$

$$T_f = \frac{T_1 + T_2}{2} = 50^{\circ}\text{C}$$

$$\Rightarrow (dS)_{\text{block1}} = C \ln\left(\frac{T_f}{T_1}\right)$$

$$= 150 \ln\left(\frac{50 + 273}{373}\right) = -21.58 \text{ J/K}$$

$$\Rightarrow (dS)_{\text{Block2}} = C \ln\left(\frac{T_f}{T_2}\right)$$

$$= 150 \ln\left(\frac{50 + 273}{273}\right) = +25.22 \text{ J/K}$$

$$\Rightarrow (dS)_{\text{uni}} = -21.58 + 25.22$$

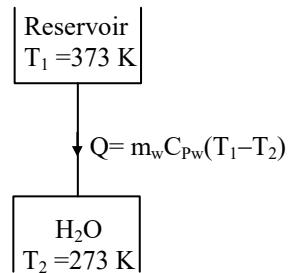

$$\Rightarrow (dS)_{\text{uni}} = 3.64 \text{ J/K}$$

$$(dS)_{\text{Universe}} > 0$$

$$(dS)_{\text{universe}} = 0.183 \text{ kJ/kg.K}$$

(b)

By providing one more reservoir at 323 K

1st stage, $(dS)_{\text{universe,1st}}$

$$\Rightarrow (ds)_{\text{universe}} = m_w C_{pw} \left[\ln \frac{T_1}{T_2} - \left(\frac{T_1 - T_2}{T_1} \right) \right]$$

$$= 0.041 \text{ kJ/kg.K}$$

$$(ds)_{\text{universe}} = (ds)_{\text{univ,2nd stage}} + (ds)_{\text{univ,1st stage}}$$

$$= 0.041 + 0.056 = 0.097 \text{ kJ/kgK}$$

$$(ds)_{\text{uni}} = 0.097 \text{ kJ/kg.K}$$

(c) From above problem, when compared to single stage heating in a two stage heating entropy is halved. As the no. of stages of heating goes on increasing, entropy change of universe are decreasing. This way we can heat the fluid with almost no change in entropy of universe.

- $$h_2'' = 216.24$$
- $$\eta_c = \frac{h_2'' - h_1}{h_2 - h_1}$$
- $$= \frac{216.24 - 177.87}{230.398 - 177.87} = 0.72$$
- (e) $\dot{m}_w \times 4.18 \times 10 = 0.2 \times (230.398 - 79.9)$
