Sol: Assertion: TRUE

If feedback is not properly utilized the closed loop system may become unstable.

Reason: True

Feedback changes the location of poles

Let $G(s) = \dfrac{-2}{s+1}$ $H(s) = 1$

Open loop pole s = –1 (stable)

$$\text{CLTF} = \frac{\frac{-2}{s+1}}{1+\frac{-2}{s+1}} = \frac{-2}{s-1}$$

Closed loop pole is at s = 1 (unstable)

$\therefore$ After applying the feedback no more system is open loop. It becomes closed loop system. Hence poles are affected.

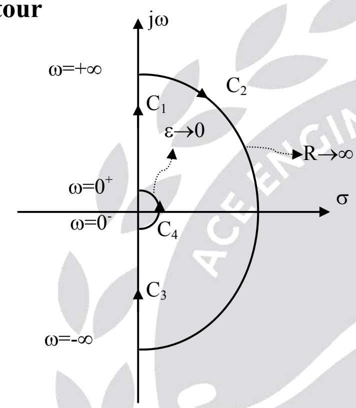
s-plane
Nyquist Contour



- Nyquist plot is the mapping of Nyquist contour(s-plane) into G(s)H(s) plane.
- The Nyquist contour in the s-plane enclosing the entire right half of S-plane is shown figure.

The Nyquist Contour has four sections C_1, C_2, C_3 and C_4. These sections are mapped into G(s)H(s) plane

Mapping of section C_1: It is the positive imaginary axis, therefore sub s = jω, (0≤ω≤∞) in the TF G(s) H(s), which gives the polar plot

$$G(s)H(s) = \frac{10(s+3)}{s(s-1)}$$

Let s = jω

$$G(j\omega)H(j\omega) = \frac{10(j\omega+3)}{j\omega(j\omega-1)}$$

$$G(j\omega)H(j\omega) = \frac{10\sqrt{\omega^2+9}}{\omega\sqrt{\omega^2+1}}\angle\left\{\tan^{-1}\left(\frac{\omega}{3}\right) - [90^0 + 180^0 - \tan^{-1}(\omega)]\right\}$$

At $\omega = 0 \Rightarrow \infty\angle -270^0$

At $\omega = \omega_{pc} = \sqrt{3} \Rightarrow 10\angle -180^0$

At $\omega = \infty \Rightarrow 0\angle -90^0$

point of intersection of the Nyquist plot with respect to negative real axis is calculated below

$$\text{Arg}G(j\omega)H(j\omega) = \arg\frac{10(j\omega+3)}{j\omega(j\omega-1)}$$

$= -180^0$ will give the 'ω_{pc}'

Magnitude of G(jω)H(jω) gives the point of intersection

$$\angle\tan^{-1}\left(\frac{\omega}{3}\right) - [90^0 + 180^0 - \tan^{-1}(\omega))$$

$$= -180^0\Big|\omega = \omega_{pc}$$

$$\angle\tan^{-1}\left(\frac{\omega_{pc}}{3}\right) - [90^0 + 180^0 - \tan^{-1}(\omega_{pc})) = -180^0$$

$$\tan^{-1}\left(\frac{\omega_{pc}}{3}\right) + \tan^{-1}(\omega_{pc}) = 90^0$$

Taking "tan" both the sides

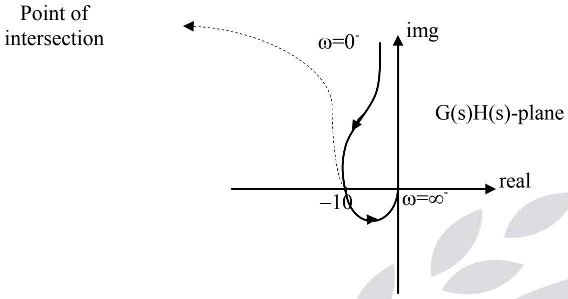
$$\frac{\frac{\omega_{pc}}{3} + \omega_{pc}}{1 - \frac{(\omega_{pc})^2}{3}} = \tan 90^0 = \infty$$

$$1 - \frac{\omega^2_{pc}}{3} = 0$$

$$\omega_{pc} = \sqrt{3} \text{ rad/sec}$$

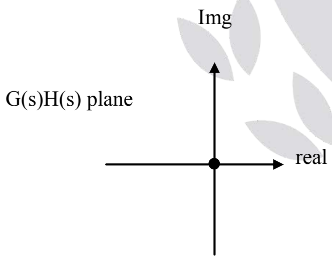
Therefore the point of intersection is

$$\left|G(j\omega)H(j\omega)\right| \text{at } \omega_{pc} = \frac{10\sqrt{\omega_{pc}^{2}+3^{2}}}{\omega_{pc}\sqrt{1+\omega_{pc}^{2}}} = 10$$



The mapping of the section C_1 is shown figure.

Mapping of section C_2: It is the radius 'R' semicircle, therefore sub $s = \lim\limits_{R\to\infty} Re^{j\theta}$ (θ is from 90^0 to 0^0 to -90^0) in the TF G(s)H(s), which merges to the origin in G(s)H(s) plane.

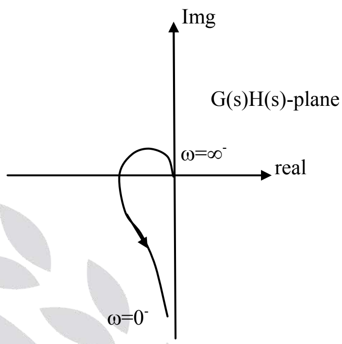


$$G(s)H(s) = \frac{10(s+3)}{s(s-1)}$$

$$G(Re^{j\theta})H(Re^{j\theta}) = \frac{2(Re^{j\theta}+3)}{Re^{j\theta}(Re^{j\theta}-1)} \approx 0$$

The plot is shown in figure.

Mapping of section C_3: It is the negative imaginary axis, therefore sub $s = j\omega$, $(-\infty \le \omega \le 0)$ in the TF G(s)H(s), which gives the mirror image of the polar plot and is symmetrical with respect to the real axis, The plot is shown in figure.



Mapping of section C_4: It is the radius 'ε' semicircle, therefore sub $s = \lim\limits_{\varepsilon\to 0} \varepsilon e^{j\theta}$ $(-90^o \le \theta \le 90^o)$ in the TF G(s)H(s), which gives clockwise infinite radius semicircle in G(s)H(s) plane.

The plot is shown below

$$G(\varepsilon e^{j\theta})H(\varepsilon e^{j\theta}) = \frac{10(\varepsilon e^{j\theta}+3)}{\varepsilon e^{j\theta}(\varepsilon e^{j\theta}-1)}$$

$$G(\varepsilon e^{j\theta})H(\varepsilon e^{j\theta}) \approx \frac{10\times 3}{-\varepsilon e^{j\theta}} = \infty\angle 180^0 - \theta$$

When, $\theta = -90^0$ $\infty\angle 270^0$

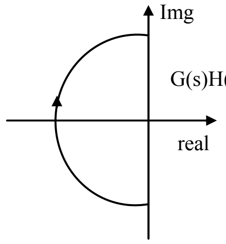
$\theta = -40^0$ $\infty\angle 220^0$

$\theta = 0^0$ $\infty\angle 0^0$

$\theta = 40^0$ $\infty\angle 140^0$

$\theta = 90^0$ $\infty\angle 90^0$

It is clear that the plot is clockwise '∞' radius semicircle centred at the origin



Combining all the above four sections, the Nyquist plot of $G(s)H(s) = \frac{10(s+3)}{s(s-1)}$ is shown in figure below

From the plot N=1

Given that P=1

N=P−Z

$$(1+sT_1) = \left(1+\frac{s}{\omega_1}\right) = \left(1+\frac{s}{Z}\right)$$

At ω = 10 rad/sec, slope is changed to –6dB/octave.

$\therefore$ change in slope = – 6 – 0

= – 6 dB/octave.

$\therefore$ There is a real pole at corner frequency $\omega_2 = 2$.

$$\frac{1}{1+sT_2} = \frac{1}{\left(1+\frac{s}{\omega_2}\right)} = \frac{1}{\left(1+\frac{s}{10}\right)}$$

At ω = 50 rad/sec, slope is changed to –12dB/octave.

$\therefore$ change in slope = – 12 – (–6)

= – 6 dB/octave

$\therefore$ There is a real pole at corner frequency ω_3 = 50 rad/sec.

$$\frac{1}{1+ST_3} = \frac{1}{\left(1+\frac{S}{\omega_3}\right)} = \frac{1}{\left(1+\frac{S}{50}\right)}$$

At ω = 100 rad/sec, the slope changed to –6 dB/octave.

$\therefore$ change in slope = – 6 – (–12) = 6 dB/octave.

$\therefore$ There is a real zero at corner frequency ω_4 = 100 rad/sec.

$$\therefore (1+sT_4) = \left(1+\frac{s}{\omega_4}\right) = \left(1+\frac{s}{100}\right)$$

$$\therefore \text{Transfer function } = \frac{K\left(1+\frac{s}{2}\right)\left(1+\frac{s}{100}\right)}{s\left(1+\frac{s}{50}\right)\left(1+\frac{s}{10}\right)}$$

$$= \frac{K(s+2)(s+100)}{s(s+50)(s+10)}\frac{\frac{1}{2}.\frac{1}{100}}{\frac{1}{50}.\frac{1}{10}}$$

$$= \frac{2.5K(s+2)(s+100)}{s(s+10)(s+50)}$$

In the given bode plot,

at ω = 1rad/sec, Magnitude = –20dB.

$$-20\text{dB} = 20\log K - 20\log\omega + 20\sqrt{1+\left(\frac{\omega}{2}\right)^2} + 20\sqrt{1+\left(\frac{\omega}{100}\right)^2}$$

$$-20\log\sqrt{1+\left(\frac{\omega}{50}\right)^2} - 20\log\sqrt{1+\left(\frac{\omega}{10}\right)^2}$$

At ω = 1 rad/sec,

–20 = 20logK – 20 logω/ω = 1 rad/sec

[$\because$ Remaining values eliminated]

– 20 = 20logK

$\Rightarrow$ K = 0.1

$\therefore$Transfer function

$$\frac{C(s)}{R(s)} = \frac{0.25(s+2)(s+100)}{s(s+10)(s+50)}$$
