Sol: Assertion: TRUE

If feedback is not properly utilized the closed loop system may become unstable.

Reason: True

Feedback changes the location of poles

$$\text{Let } G(s) = \frac{-2}{s+1} \quad H(s) = 1$$

Open loop pole $s = -1$ (stable)

$$\text{CLTF} = \frac{\frac{-2}{s+1}}{1 + \frac{-2}{s+1}} = \frac{-2}{s-1}$$

Closed loop pole is at $s = 1$ (unstable)

\therefore After applying the feedback no more system is open loop. It becomes closed loop system. Hence poles are affected.

s-plane
Nyquist Contour

- Nyquist plot is the mapping of Nyquist contour(s-plane) into $G(s)H(s)$ plane.
- The Nyquist contour in the s-plane enclosing the entire right half of S-plane is shown figure.

The Nyquist Contour has four sections C_1 , C_2 , C_3 and C_4 . These sections are mapped into $G(s)H(s)$ plane

Mapping of section C_1 : It is the positive imaginary axis, therefore sub $s = j\omega$, $(0 \leq \omega \leq \infty)$ in the TF $G(s) H(s)$, which gives the polar plot

$$G(s)H(s) = \frac{10(j\omega + 3)}{j\omega(j\omega - 1)}$$

$$\begin{aligned} G(j\omega)H(j\omega) &= \frac{10\sqrt{\omega^2+9}}{\omega\sqrt{\omega^2+1}} \angle \left\{ \tan^{-1}\left(\frac{\omega}{3}\right) \right. \\ &\quad \left. - [90^\circ + 180^\circ - \tan^{-1}(\omega)] \right\} \end{aligned}$$

$$G(j\omega)H(j\omega) = \frac{10(j\omega + 3)}{j\omega(j\omega - 1)}$$

At $\omega = 0 \Rightarrow \infty \angle -270^\circ$

At $\omega = \omega_{pc} = \sqrt{3} \Rightarrow 10 \angle -180^\circ$

At $\omega = \infty \Rightarrow 0 \angle -90^\circ$

point of intersection of the Nyquist plot with respect to negative real axis is calculated below

$$\text{Arg } G(j\omega)H(j\omega) = \arg \frac{10(j\omega+3)}{j\omega(j\omega-1)}$$

$= -180^\circ$ will give the ' ω_{pc} '

Magnitude of $G(j\omega)H(j\omega)$ gives the point of intersection

$$\angle \tan^{-1}\left(\frac{\omega}{3}\right) - [90^\circ + 180^\circ - \tan^{-1}(\omega)]$$

$$= -180^\circ | \omega = \omega_{pc}$$

$$\angle \tan^{-1}\left(\frac{\omega_{pc}}{3}\right) - [90^\circ + 180^\circ - \tan^{-1}(\omega_{pc})] = -180^\circ$$

$$\tan^{-1}\left(\frac{\omega_{pc}}{3}\right) + \tan^{-1}(\omega_{pc}) = 90^\circ$$

Taking "tan" both the sides

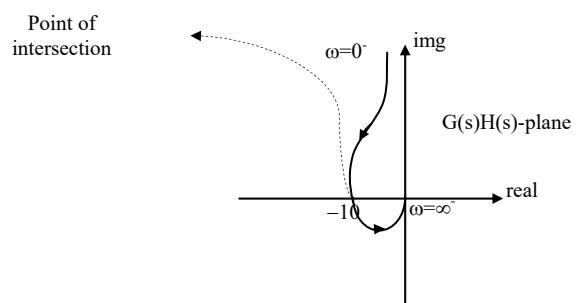

$$\frac{\frac{\omega_{pc}}{3} + \omega_{pc}}{1 - \frac{(\omega_{pc})^2}{3}} = \tan 90^\circ = \infty$$

$$1 - \frac{\omega_{pc}^2}{3} = 0$$

$$\omega_{pc} = \sqrt{3} \text{ rad/sec}$$

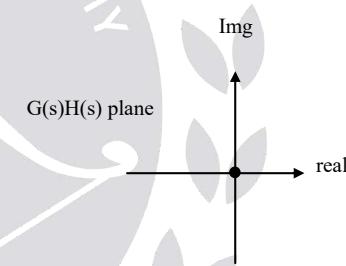

Therefore the point of intersection is

$$|G(j\omega)H(j\omega)| \text{ at } \omega_{pc} = \frac{10\sqrt{\omega_{pc}^2 + 3^2}}{\omega_{pc}\sqrt{1 + \omega_{pc}^2}} = 10$$

The mapping of the section C_1 is shown figure.

Mapping of section C_2 : It is the radius 'R' semicircle, therefore sub $s = \lim_{R \rightarrow \infty} Re^{j\theta}$ (θ is from 90° to 0° to -90°) in the TF $G(s)H(s)$, which merges to the origin in $G(s)H(s)$ plane.

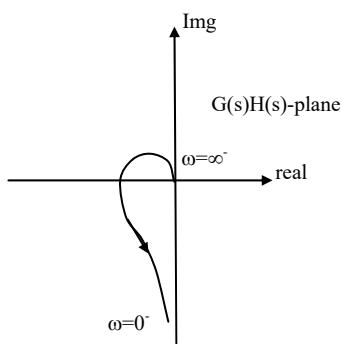

$$G(s)H(s) = \frac{10(s+3)}{s(s-1)}$$

$$G(Re^{j\theta})H(Re^{j\theta}) = \frac{2(Re^{j\theta}+3)}{Re^{j\theta}(Re^{j\theta}-1)} \approx 0$$

The plot is shown in figure.

Mapping of section C_3 : It is the negative imaginary axis, therefore sub $s = j\omega$, $(-\infty \leq \omega \leq 0)$ in the TF $G(s)H(s)$, which gives the mirror image of the polar plot and is symmetrical with respect to the real axis, The plot is shown in figure.

Mapping of section C₄: It is the radius ' ϵ ' semicircle, therefore sub $s = \lim_{\epsilon \rightarrow 0} \epsilon e^{j\theta}$ ($-90^\circ \leq \theta \leq 90^\circ$) in the TF $G(s)H(s)$, which gives clockwise infinite radius semicircle in $G(s)H(s)$ plane.

The plot is shown below

$$G(\epsilon e^{j\theta})H(\epsilon e^{j\theta}) = \frac{10(\epsilon e^{j\theta} + 3)}{\epsilon e^{j\theta}(\epsilon e^{j\theta} - 1)}$$

$$G(\epsilon e^{j\theta})H(\epsilon e^{j\theta}) \approx \frac{10 \times 3}{-\epsilon e^{j\theta}} = \infty \angle 180^\circ - \theta$$

$$\text{When, } \theta = -90^\circ \quad \infty \angle 270^\circ$$

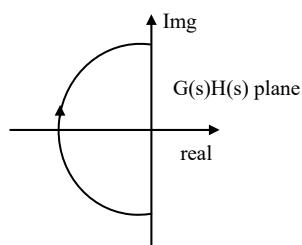

$$\theta = -40^\circ \quad \infty \angle 220^\circ$$

$$\theta = 0^\circ \quad \infty \angle 0^\circ$$

$$\theta = 40^\circ \quad \infty \angle 140^\circ$$

$$\theta = 90^\circ \quad \infty \angle 90^\circ$$

It is clear that the plot is clockwise ' ∞ ' radius semicircle centred at the origin

Combining all the above four sections, the

$$\text{Nyquist plot of } G(s)H(s) = \frac{10(s+3)}{s(s-1)}$$

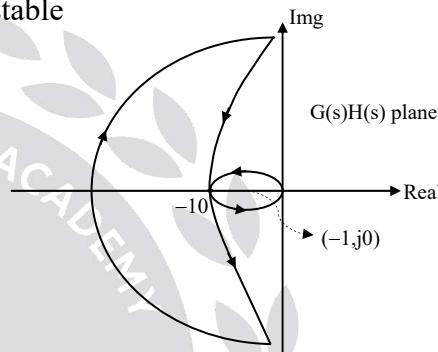

is shown in figure below

From the plot $N=1$

Given that $P=1$

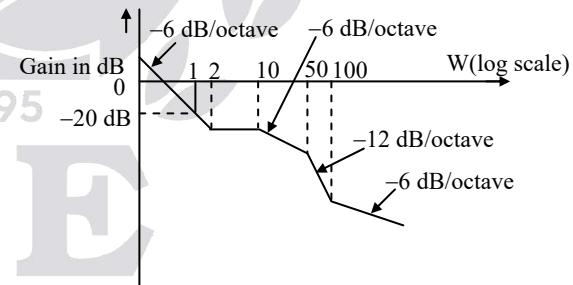

$$N=P-Z$$

$Z = P - N = 1 - 1 = 0$, therefore system is stable

Sol: The given bode plot is shown below.

Initial slope = -6 db/octave .

i.e., there is one pole at origin (or) one integral term.
portion of transfer function

$$G(s) = \frac{K}{s}$$

At $\omega = 2 \text{ rad/sec}$, slope is changed to 0 dB/octave .

∴ change in slope = present slope – previous slope
 $= 0 - (-6) = 6 \text{ dB/octave}$

∴ There is a real zero at corner frequency
 $\omega_1 = 2.$

$$(1+sT_1) = \left(1 + \frac{s}{\omega_1}\right) = \left(1 + \frac{s}{Z}\right)$$

At $\omega = 10 \text{ rad/sec}$, slope is changed to -6 dB/octave .

$$\begin{aligned} \therefore \text{change in slope} &= -6 - 0 \\ &= -6 \text{ dB/octave.} \end{aligned}$$

∴ There is a real pole at corner frequency
 $\omega_2 = 2.$

$$\frac{1}{1+sT_2} = \frac{1}{\left(1 + \frac{s}{\omega_2}\right)} = \frac{1}{\left(1 + \frac{s}{10}\right)}$$

At $\omega = 50 \text{ rad/sec}$, slope is changed to -12 dB/octave .

$$\begin{aligned} \therefore \text{change in slope} &= -12 - (-6) \\ &= -6 \text{ dB/octave} \end{aligned}$$

∴ There is a real pole at corner frequency
 $\omega_3 = 50 \text{ rad/sec.}$

$$\frac{1}{1+sT_3} = \frac{1}{\left(1 + \frac{s}{\omega_3}\right)} = \frac{1}{\left(1 + \frac{s}{50}\right)}$$

At $\omega = 100 \text{ rad/sec}$, the slope changed to -6 dB/octave .

$$\therefore \text{change in slope} = -6 - (-12) = 6 \text{ dB/octave.}$$

∴ There is a real zero at corner frequency
 $\omega_4 = 100 \text{ rad/sec.}$

$$\therefore (1+sT_4) = \left(1 + \frac{s}{\omega_4}\right) = \left(1 + \frac{s}{100}\right)$$

$$\therefore \text{Transfer function} = \frac{K \left(1 + \frac{s}{2}\right) \left(1 + \frac{s}{100}\right)}{s \left(1 + \frac{s}{50}\right) \left(1 + \frac{s}{10}\right)}$$

$$= \frac{K(s+2)(s+100)}{s(s+50)(s+10)} \cdot \frac{\frac{1}{2} \cdot \frac{1}{100}}{\frac{1}{50} \cdot \frac{1}{10}}$$

$$= \frac{2.5K(s+2)(s+100)}{s(s+10)(s+50)}$$

In the given bode plot,

at $\omega = 1 \text{ rad/sec}$, Magnitude = -20 dB .

$$-20 \text{ dB} = 20 \log K - 20 \log \omega + 20 \sqrt{1 + \left(\frac{\omega}{2}\right)^2} + 20 \sqrt{1 + \left(\frac{\omega}{100}\right)^2}$$

$$-20 \log \sqrt{1 + \left(\frac{\omega}{50}\right)^2} - 20 \log \sqrt{1 + \left(\frac{\omega}{10}\right)^2}$$

At $\omega = 1 \text{ rad/sec}$,

$$-20 = 20 \log K - 20 \log \omega / \omega = 1 \text{ rad/sec}$$

[∴ Remaining values eliminated]

$$\begin{aligned} -20 &= 20 \log K \\ \Rightarrow K &= 0.1 \end{aligned}$$

∴ Transfer function

$$\frac{C(s)}{R(s)} = \frac{0.25(s+2)(s+100)}{s(s+10)(s+50)}$$
