118. Ans: (d)

Sol: Speed $\propto \mathrm{N}_{\mathrm{s}}=\frac{120 \mathrm{f}}{\mathrm{P}}$ as $\mathrm{f} \downarrow$, speed $\downarrow$

Motor output $=$ Torque $\times$ speed
But torque $=$ constant
So motor output decreases as speed decreases

$\frac{\mathrm{E}_{\mathrm{b} 1}}{\mathrm{E}_{\mathrm{b} 2}}=\frac{\mathrm{N}_{1}}{\mathrm{~N}_{2}}$
$\Rightarrow \frac{\mathrm{V}-\mathrm{I}_{\mathrm{a} 1} \mathrm{R}_{\mathrm{a}}}{\mathrm{V}-\mathrm{I}_{\mathrm{a} 2}\left(\mathrm{R}_{\mathrm{a}}+\mathrm{R}_{\mathrm{se}}\right)}=\frac{900}{600}$
$\Rightarrow \frac{250-(30 \times 0.4)}{250-20\left(0.4+\mathrm{R}_{\text {se }}\right)}=\frac{900}{600}$

Materials have different structures of intrinsic magnetic moments that depend on
temperature. At a material's Curie Temperature those intrinsic magnetic moments change direction.

- In both PAL \& PLAs outputs of OR gates are directly connected to output pins of the chip.
This kind of configuration will limit us to use PAL (or) PLA for only combinational circuit design, as there are no flipflops. To design a sequential circuit, we must add the flipflops externally to the chip.
