Sol: Given that $\mathrm{z}=f(\mathrm{x}, \mathrm{y})$, where $\mathrm{x}=\mathrm{e}^{\mathrm{u}}+\mathrm{e}^{-\mathrm{v}}$ and $\mathrm{y}=\mathrm{e}^{-\mathrm{u}}-\mathrm{e}^{\mathrm{v}}$
Then $\frac{\partial z}{\partial u}=\frac{\partial z}{\partial x} \frac{\partial x}{\partial u}+\frac{\partial z}{\partial y} \frac{\partial y}{\partial u} \quad$ and $\quad \frac{\partial z}{\partial v}=\frac{\partial z}{\partial x} \frac{\partial x}{\partial v}+\frac{\partial z}{\partial y} \frac{\partial y}{\partial v}$
$\Rightarrow \quad \frac{\partial \mathrm{z}}{\partial \mathrm{u}}=\frac{\partial \mathrm{z}}{\partial \mathrm{x}}\left(\mathrm{e}^{\mathrm{u}}\right)+\frac{\partial \mathrm{z}}{\partial \mathrm{y}}\left(-\mathrm{e}^{-\mathrm{u}}\right)$ and $\frac{\partial \mathrm{z}}{\partial \mathrm{v}}=\frac{\partial \mathrm{z}}{\partial \mathrm{x}}\left(-\mathrm{e}^{-\mathrm{v}}\right)+\frac{\partial \mathrm{z}}{\partial \mathrm{y}}\left(-\mathrm{e}^{\mathrm{v}}\right)$
Now, $\frac{\partial \mathrm{z}}{\partial \mathrm{u}}-\frac{\partial \mathrm{z}}{\partial \mathrm{v}}=\left(\mathrm{e}^{\mathrm{u}} \frac{\partial \mathrm{z}}{\partial \mathrm{x}}-\mathrm{e}^{-\mathrm{u}} \frac{\partial \mathrm{z}}{\partial \mathrm{y}}\right)-\left(-\mathrm{e}^{-\mathrm{v}} \frac{\partial \mathrm{z}}{\partial \mathrm{x}}-\mathrm{e}^{\mathrm{v}} \frac{\partial \mathrm{z}}{\partial \mathrm{y}}\right)$

Sol: Let $u+i v=f(z)=\left(x^{2}+c_{1} y^{2}-2 x y\right)+i\left(c_{2} x^{2}-y^{2}+2 x y\right)$ be the analytic function.
Then the real and imaginary parts of an analytic functions will satisfy $C-R$ euqaitons.

$$
\begin{aligned}
& \text { i.e., } \mathrm{u}_{\mathrm{x}}=\mathrm{v}_{\mathrm{y}} \quad \text { and } \mathrm{v}_{\mathrm{x}}=-\mathrm{u}_{\mathrm{y}} \\

& \Rightarrow 2 \mathrm{c}_{2} \mathrm{x}+2 \mathrm{y}=2 \mathrm{x}-2 \mathrm{c}_{1} \mathrm{y} \\
& \therefore \quad \mathrm{c}_{1}=-1 \text { and } \mathrm{c}_{2}=1

## Sol:

For a given circle centre is $(5,5)$ and radius is 2

$$
\begin{aligned}
& \mathrm{OC}=\sqrt{O A^{2}+A C^{2}}=\sqrt{25+25} \\
& \quad=\sqrt{50}=5 \sqrt{2} \\
& \mathrm{OB}=\mathrm{OC}-\mathrm{BC} \\
& \quad=5 \sqrt{2}-2
\end{aligned}
$$

$\therefore$ The minimum distance from the origin to the circle is $5 \sqrt{2}-2$

## 35. Ans: (b)

Sol: The solution to the above differential equation is

$$
\begin{aligned}
y(I F) & =\int Q(I F) d x \\
\Rightarrow y\left(1+x^{2}\right) & =\int \frac{4 x^{2}}{\left(1+x^{2}\right)} \times\left(1+x^{2}\right) d x \\
\Rightarrow y\left(1+x^{2}\right) & =\frac{4 x^{3}}{3}+c
\end{aligned}
$$

But it is passing through origin,
we get, $\mathrm{c}=0$
$\therefore$ The equation of the curve is

$$
\begin{aligned}
& y\left(1+x^{2}\right)=\frac{4 x^{3}}{3} \quad \text { (or) } \\
& 3 y\left(1+x^{2}\right)=4 x^{3}
\end{aligned}
$$

36. Ans: (d)

Sol: Given $u_{t}=c^{2} u_{x x}$
with B.C's
$u(0, t)=0\}$
$u(\pi, t)=0$
$\& I . C u(x, 0)=\sin x=f(x)$
Now, the solution of (1) is given by
$u(x, t)=\sum_{n=1}^{\infty} a_{n} \sin \frac{n \pi x}{\ell} e^{\left(\frac{-\mathrm{n}^{2} \pi^{2} \mathrm{c}^{2}}{\ell^{2}}\right) t}$
where $\mathrm{a}_{\mathrm{n}}=\frac{2}{\ell} \int_{0}^{\ell} \mathrm{f}(\mathrm{x}) \sin \frac{\mathrm{n} \pi \mathrm{x}}{\ell} \mathrm{dx}$
put $t=0$ in (4), we get

$$
\begin{aligned}
& u(x, 0)=\sum_{n=1}^{\infty} a_{n} \sin \left(\frac{n \pi x}{\ell}\right) \\
& \Rightarrow \sin (x)=\sum_{n=1}^{\infty} a_{n} \sin \left(\frac{n \pi x}{\ell}\right) \\
& \quad=a_{1} \sin (x)+a_{2} \sin (2 x)+ \\
& \Rightarrow \sin (x)=a_{1} \sin x+\ldots \ldots(\ell=\pi, n=1) \\
& \therefore a_{1}=1, a_{2}=0 \ldots a_{3}=0 \ldots .
\end{aligned}
$$

From (4), the solution of (1) with (2) \& (3) is
$u(x, t)=a_{1} \sin (x) \cdot e^{-c^{2} t}$
$\therefore \mathrm{u}(\mathrm{x}, \mathrm{t})=\sin (\mathrm{x}) . \mathrm{e}^{-\mathrm{c}^{2} \mathrm{t}}$

## 37. Ans: (a)

Sol: The given equation is

$$
\left(5 x^{3}+3 x y+2 y^{2}\right) d x+\left(x^{2}+2 x y\right) d y=0
$$

Let, $M=5 x^{3}+3 x y+2 y^{2}$ and $N=x^{2}+2 x y$
$\Rightarrow \frac{\partial \mathrm{M}}{\partial \mathrm{y}}=3 \mathrm{x}+4 \mathrm{y} \quad$ and $\quad \frac{\partial \mathrm{N}}{\partial \mathrm{x}}=2 \mathrm{x}+2 \mathrm{y}$
$\Rightarrow \frac{\partial M}{\partial y}-\frac{\partial N}{\partial x}=x+2 y$
$\Rightarrow \frac{1}{N}\left(\frac{\partial M}{\partial y}-\frac{\partial N}{\partial x}\right)=\frac{x+2 y}{x^{2}+2 x y}=\frac{1}{x}$
$\therefore$ I.F $=\mathrm{e}^{\int \frac{1}{\mathrm{x}} \mathrm{dx}}=\mathrm{x}$
$\Rightarrow \mathrm{k}=1$
Multiplying the given Differential Equation by the integrating factor, we get

$$
\left(5 x^{4}+3 x^{2} y+2 x y^{2}\right) d x+\left(x^{3}+2 x^{2} y\right) d y=0
$$

which is exact
The solution is $\int\left(5 x^{4}+3 x^{2} y+2 x y^{2}\right) d x=c$

$$
\therefore \mathrm{x}^{5}+\mathrm{x}^{3} \mathrm{y}+\mathrm{x}^{2} \mathrm{y}^{2}=\mathrm{c}
$$

Now, $y_{P}=\frac{1}{f(D)}\left[e^{-2 x} x^{4}\right]$
$\Rightarrow y_{P}=e^{-2 x}\left[\frac{1}{f(D-2)} x^{4}\right]$
$\Rightarrow y_{P}=e^{-2 x}\left[\frac{1}{(D-2)^{2}+4(D-2)+4} x^{4}\right]$

$$
\begin{aligned}
& \Rightarrow y_{P}=e^{-2 x}\left[\frac{1\left(\mathrm{x}^{4}\right)}{\mathrm{D}^{2}}\right] \\

$\frac{\partial \mathbf{M}}{\partial r}=\sin \theta$ and $\frac{\partial \mathrm{N}}{\partial \theta}=+2 \mathrm{r}^{2} \sin \theta-\sin \theta$
$\frac{1}{\mathrm{M}}\left(\frac{\partial \mathrm{N}}{\partial \theta}-\frac{\partial \mathrm{M}}{\partial \mathrm{r}}\right)=2\left(\mathrm{r}-\frac{1}{\mathrm{r}}\right)$
Integrating factor is

$$
\text { I.F }=e^{\int 2\left(\mathrm{r}-\frac{1}{\mathrm{r}}\right) \mathrm{dr}}=\frac{\mathrm{e}^{\mathrm{r}^{2}}}{\mathrm{r}^{2}}
$$

Differentiating (2) partially with respect to y $q-x=\phi^{1}\left(x^{2}+y^{2}\right) \cdot 2 y$ $\qquad$
Dividing (2) by (3)

$$
\begin{aligned}

Sol: Given $f(x, y)=2\left(x^{2}-y^{2}\right)-x^{4}+y^{4}$
Consider $f_{x}=4 x-4 x^{3}=0$
$\Rightarrow \mathrm{x}=0,1,-1$
Consider $f_{y}=-4 y+4 y^{3}=0$
$\Rightarrow \mathrm{y}=0,1,-1$
Now, $r=f_{x y}=4-12 x^{2}, s=f_{x y}=0$
and $t=f_{y y}=-4+12 y^{2}$

At $(0,1)$, we have $\mathrm{r}>0$ and $\left(\mathrm{rt}-\mathrm{s}^{2}\right)>0$
$\therefore \mathrm{f}(\mathrm{x}, \mathrm{y})$ has minimum at $(0,1)$
At $(-1,0)$, we have $\mathrm{r}<0$ and $\left(\mathrm{rt}-\mathrm{s}^{2}\right)>0$
$\therefore \mathrm{f}(\mathrm{x}, \mathrm{y})$ has a maximum at $(-1,0)$

The unit vector along the line making angle $30^{\circ}$ with positive x -axis at the point $(0,1)=\left(\cos 30^{\circ} \mathrm{i}+\sin 30^{\circ} \mathrm{j}\right)$
