01.

Sol:

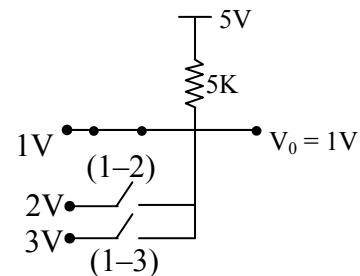

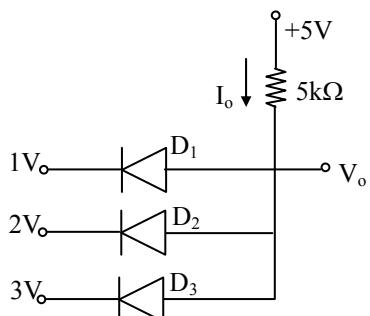

$\Rightarrow$  D<sub>1</sub>, D<sub>2</sub> are reverse biased and D<sub>3</sub> is forward biased.

i.e., D<sub>3</sub> only conducts.

$$\therefore I_0 = 3/5K = 0.6mA$$

02.

Sol:

$\Rightarrow$  D<sub>2</sub> & D<sub>3</sub> are reverse biased and 'D<sub>1</sub>' is forward biased.

i.e., D<sub>1</sub> only conduct

$$\therefore I_0 = \frac{5 - 1}{5K} = 0.8mA$$

03.

Sol: Let diodes D<sub>1</sub> & D<sub>2</sub> are forward biased.

$$\Rightarrow V_o = 0 \text{ volt}$$

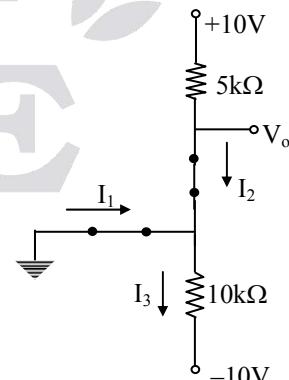

$$I_2 = \frac{10 - 0}{5K} = 2mA$$

$$I_3 = \frac{0 - (-10)}{10K} = 1mA$$

Apply KVL at nodes 'V<sub>o</sub>':

$$-I_1 + I_3 - I_2 = 0$$

$$\Rightarrow I_1 = -(I_2 - I_3) = -1mA$$

So, D<sub>1</sub> is reverse biased & D<sub>2</sub> is forward biased

$\Rightarrow$  'D<sub>1</sub>' act as an open circuit & D<sub>2</sub> is act as short circuit.

For  $\theta \rightarrow$  Range from  $0 \rightarrow \frac{\pi}{2}$ ,

$D_1 \rightarrow$  Short  
 $D_2 \rightarrow$  Open

Now at  $\theta = \frac{\pi}{2}$ ,  $V_{c_1} = V_m$

$D_1$  &  $D_2$  both are OFF

So,  $C_1$  has no discharging path  $\Rightarrow$  steady state,

So, at steady state  $V_{c_1} = +V_m = +5V$ .

Since in ANALOG circuit, for either clamps (or) for Ripple removal shunt capacitor filter,

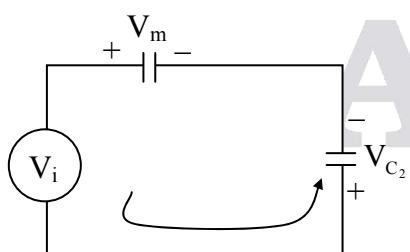

$T_{\text{discharge}} \gg T$ , where  $T \rightarrow$  Time period.

Now for  $\theta > \frac{\pi}{2}$ ,  $V_{c_1} = V_m > V_i$

$\Rightarrow$  Due to  $V_{c_1}$ ,  $D_1$  is OFF

$D_2$  is ON

Now circuit is  $\rightarrow$

$$\text{Now, } V_i = V_{c_1} - V_{c_2} \Rightarrow V_{c_2} = V_{c_1} - V_i$$

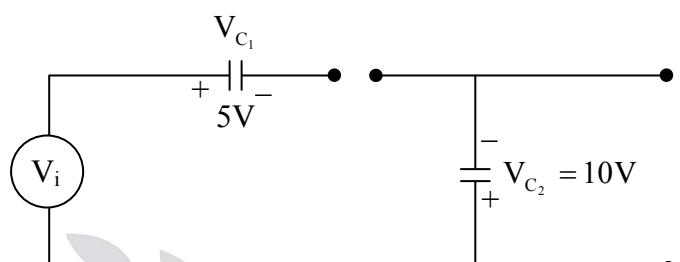

Now, at  $\theta = \frac{3\pi}{2}$ ,  $V_i = -V_m$

$$\Rightarrow V_{c_2} = 2V_m = 10V$$

Now, at  $\theta = \frac{3\pi}{2}$ ,  $V_{c_1} = 5V$  from the circuit such that,  $V_{c_2} = 10V$

Due to  $V_{c_2}$ ,  $D_2$  act as open circuit

So, at  $\theta = \frac{3\pi}{2}$ , the circuit looks like  $\rightarrow$

Now, as no discharge path for  $C_1$  &  $C_2$   
 $\Rightarrow$  Steady state

So, at steady state,  $V_{c_2} = 10V$ , but form circuit  $V_{c_2}$  polarity is opposite

$$\Rightarrow V_{c_2} = -10V$$

So, options (a) & (c) are correct.

**Sol:** For positive half cycle diode Forward biased and Capacitor start charging towards peak value.

$$\Rightarrow V_C = V_m = 5V$$

$$\Rightarrow V_0 = V_{in} - V_C = V_{in} - 5$$

$V_{in}$  range =  $-5V$  to  $+5V$

$$\therefore V_0$$
 range =  $-10V$  to  $0V$

08.

**Sol:** For +ve cycle, diode 'ON', then capacitor starts charging

$$\Rightarrow V_C = V_m - 7 = 10 - 7 = 3V$$

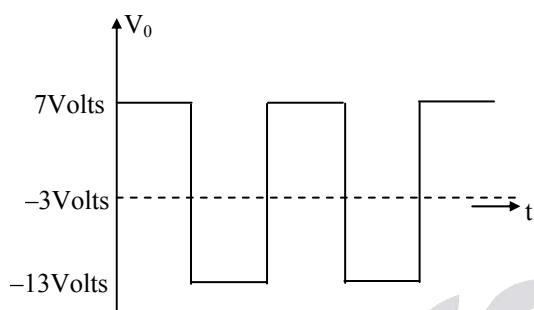

Now diode OFF for rest of cycle

$$\Rightarrow V_0 = -V_C + V_{in}$$

$$= V_{in} - 3$$

$V_{in}$  range : -10V to +10V

$\therefore V_0$  range: -13V to 7V

09.

**Sol:** Always start the analysis of clamping circuit with that part of the cycle that will forward bias the diodes this diode is forward bias during negative cycle.

For negative cycle diode ON, then capacitor starts charging

$$\Rightarrow V_C = V_p + 9$$

$$= 12 + 9 = 21V$$

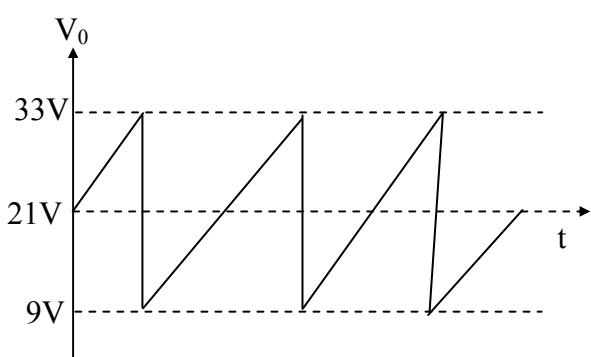

Now diode OFF for rest of cycle.

$$\Rightarrow V_0 = V_C + V_{in}$$

$$= 21 + V_{in}$$

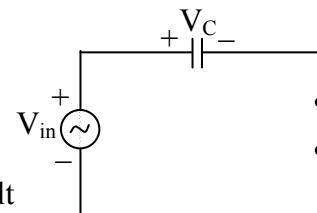

$V_{in}$  range: -12 to +12V

$V_0$  range: 9V to 33V

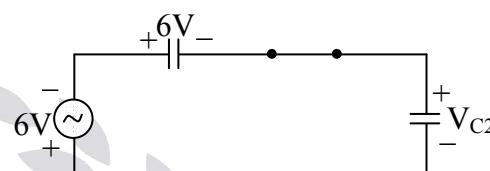

10.

**Sol:** During positive cycle,  
D<sub>1</sub> forward biased & D<sub>2</sub> Reverse biased.

$$V_{C1} = V_{in} = 6\text{ volt}$$

During negative cycle,  
D<sub>1</sub> reverse biased & D<sub>2</sub> forward biased.

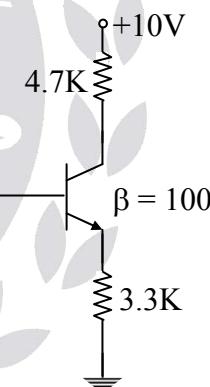

$$V_{C2} = -6 - 6 = -12V$$

Capacitor C<sub>2</sub> will charge to negative voltage of magnitude 12V

$$\Rightarrow I_C = \frac{0.5 + 10}{5K} = 2.1mA$$

$$I_B = I_E - I_C = 7.2mA$$

$$\beta_{forced} = \frac{I_{c(sat)}}{I_B} = \frac{2.1}{7.2} = 0.29$$

 $\beta_{forced} < \beta_{active}$  i.e., saturation region
**16.****Sol:**

**Step-3:** From equation (2),

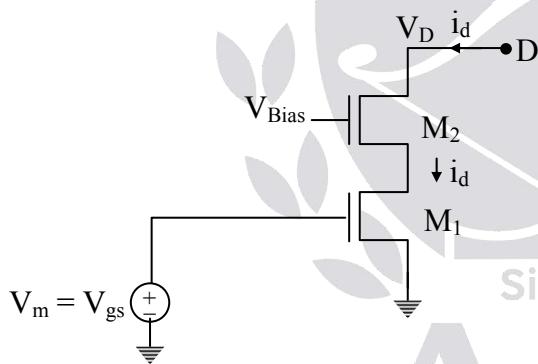

$$I_{Z_{\max}} = I_S - I_{L_{\min}} = 200 \text{mA} \dots\dots(7)$$

$$\Rightarrow P_{Z_{\max}} = V_Z I_{Z_{\max}} = 12 \times 200 \text{mA} \\ = 2.4 \text{ Watts}$$

∴ For satisfactory voltage regulation in the circuit, the power rating of zener diode should be more than 2.4 Watts.

**Sol:** The circuit given is the MOS cascode amplifier. Transistor M<sub>1</sub> is connected in common source configuration and provides its output to the input terminals (i.e., source) of transistor M<sub>2</sub>. Transistor M<sub>2</sub> has a constant dc voltage, V<sub>bias</sub> applied at its gate. Thus the signal voltage at the gate of M<sub>2</sub> is zero and M<sub>2</sub> is operating as a CG amplifier. Which is current Buffer.

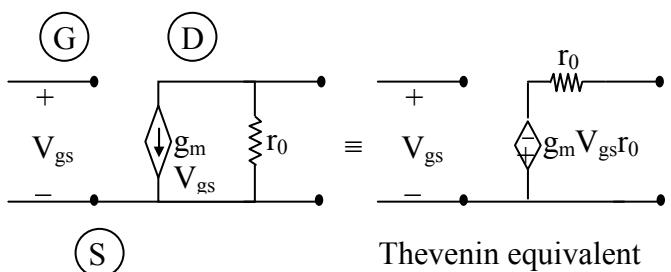

Overall transconductance

$$g_m = \frac{i_d}{V_{gs}} = \left[ \frac{\partial i_d}{\partial V_{GS}} \right] = \frac{i_{d_1}}{V_{gs_1}} \\ = g_{m_1}$$

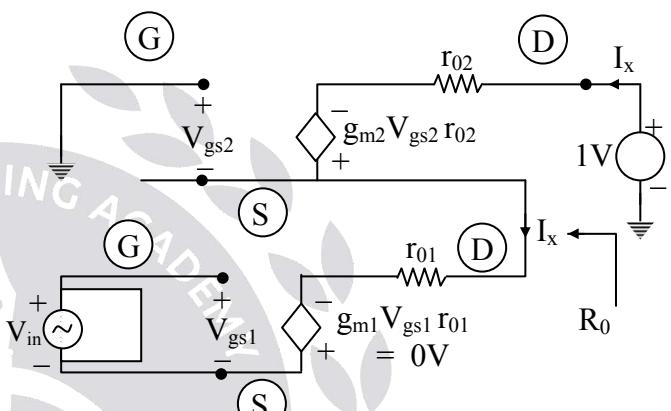

The overall (approximate) transconductance of the cascode amplifier is equal to the transconductance of common source amplifier  $g_{m_1}$ .

### AC model of MOSFET

Thevenin equivalent

Let us find the output resistance  $R_o = \frac{1V}{I_x}$

$$\text{By KVL } V_{gs2} + I_x r_{01} = 0$$

$$V_{gs2} = -I_x r_{01} \dots\dots(1)$$

By KVL

$$-1 + I_x r_{02} - g_{m2} r_{02} V_{gs2} + I_x r_{01} = 0$$

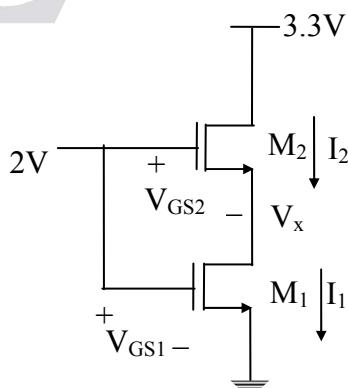

$$-1 + I_x r_{02} + g_{m2} r_{02} I_x r_{01} + I_x r_{01} = 0$$

$$\therefore I_x = \frac{1}{r_{01} + r_{02} + g_{m2} r_{02} r_{01}} \approx \frac{1}{g_{m2} r_{01} r_{02}}$$

$$R_o = \frac{1}{I_x} = g_{m2} r_{01} r_{02}$$

**61.**

**Sol:**

$$\left(\frac{W}{L}\right)_2 = 2 \left(\frac{W}{L}\right)_1$$

$V_{TH} = 1V$  for both  $M_1$  and  $M_2$

For  $M_2$  to be in saturation:

$$V_D > V_G - V_{TH}$$

$$3.3 > 2 - 1$$

$$3.3 > 1$$

So  $M_2$  will be in saturation if it is ON.

For  $M_1$  to be in saturation:

$$V_D > V_G - V_{TH}$$

$$V_X > 2 - 1$$

$V_X > 1V$  but if  $V_X$  is more than 1V,  $V_{GS2}$  becomes less than 1V, Which means  $M_2$  will be off so  $M_1$  can not be in saturation.

Now, We can conclude that  $M_1$  is in triode and  $M_2$  is in saturation

$$V_{GS1} = 2V$$

$$V_{DS1} = V_X$$

$$V_{GS2} = 2 - V_X$$

$$\text{Now, } I_1 = I_2$$

$$\mu_n C_{ox} \left(\frac{W}{L}\right)_1 \left[ (V_{GS1} - V_{TH}) V_{DS1} - \frac{1}{2} V_{DS1}^2 \right]$$

$$= \frac{1}{2} \mu_n C_{ox} \left(\frac{W}{L}\right)_2 (V_{GS2} - V_{TH})^2$$

$$V_x - \frac{1}{2} V_x^2 = (1 - V_x)^2$$

$$3V_x^2 - 6V_x + 2 = 0$$

$$V_x = 0.42V, - 1.58V$$

$V_x$  cannot be more than 1V, since  $M_2$  will become off

$$\text{So, } V_x = 0.42 V$$
