$$
\begin{aligned}
& E_{\text {stored upto } 6 \text { sec }}=\int_{0}^{6} P_{L} d t=\int_{0}^{6} v_{L}(t) i_{L}(t) d t \\
& =\int\left(L \frac{\operatorname{di}(\mathrm{t})}{\mathrm{dt}} . i(\mathrm{t})\right) \mathrm{dt} \\
& =\int_{0}^{2}\left(2\left[\frac{\mathrm{~d}}{\mathrm{dt}}(3 \mathrm{t})\right] \times 3 \mathrm{t}\right) \mathrm{dt}+\int_{2}^{4}\left(2\left[\frac{\mathrm{~d}}{\mathrm{dt}}(6)\right] \times 6\right) \mathrm{dt} \\

Sol: The energy absorbed by the inductor $(1 \Omega, 2 \mathrm{H})$ upto first 6 sec :

$$
\mathrm{E}_{\text {absorbed }}=\mathrm{E}_{\text {dissipated }}+\mathrm{E}_{\text {stored }}
$$

Energy is dissipated in the resistor

$$
\begin{aligned}
& E_{\text {dissipated }}=\int P_{R} d t=\int(i(t))^{2} R d t \\
= & \int_{0}^{2}(3 t)^{2} \times 1 d t+\int_{2}^{4}(6)^{2} \times 1 d t+\int_{4}^{6}(-3 t+18)^{2} \times 1 d t \\

$$

$=24+72+24$
$=120 \mathrm{~J}$
$\therefore \mathrm{E}_{\text {dissipated }}=120 \mathrm{~J}$
And $E_{\text {stored upto 6sec }}=0 \mathrm{~J}$
$\therefore \mathrm{E}_{\text {absorbed }}=\mathrm{E}_{\text {dissipated }}+\mathrm{E}_{\text {stored }}$
$\Rightarrow \mathrm{E}_{\text {absorbed }}=120 \mathrm{~J}+0 \mathrm{~J}=120 \mathrm{~J}$

Sol: Point $(-20,0) \Rightarrow V=-20 \mathrm{~V}$ and $\mathrm{I}=0 \mathrm{~A}$

By $\mathrm{KVL} \Rightarrow \mathrm{I}_{\mathrm{S}} \mathrm{R}_{\mathrm{S}}-\mathrm{V}=0$
$\Rightarrow \mathrm{I}_{\mathrm{S}} \mathrm{R}_{\mathrm{S}}+20=0$
$\Rightarrow \mathrm{I}_{\mathrm{S}} \mathrm{R}_{\mathrm{S}}=-20 \mathrm{~V}$
Point: $(0,-2) \Rightarrow \mathrm{V}=0 \mathrm{~V}$ and $\mathrm{I}=-2 \mathrm{~A}$

$$
\begin{aligned}
& \mathrm{I}_{\mathrm{s}}=\mathrm{I} \\

11. Ans: (d)

Sol:

Here the 2 V voltage source and 3 V voltage source are in parallel which violates the KVL. Hence such circuit does not exist. (But practical voltage sources will have some internal resistance so that when two unequal voltage sources are connected in parallel current can flow and such a circuit may exist).
12. Ans: (d)

Applying KVL,
$-\mathrm{V}_{1}+12\left(\mathrm{I}_{\text {in }}-\frac{\mathrm{V}_{1}}{5}\right)+2\left(\mathrm{I}_{\text {in }}-\frac{16 \mathrm{~V}_{1}}{5}\right)=0$
$-\mathrm{V}_{1}+12 \mathrm{I}_{\mathrm{in}}-\frac{12 \mathrm{~V}_{1}}{5}+2 \mathrm{I}_{\mathrm{in}}-\frac{32 \mathrm{~V}_{1}}{5}=0$
$14 \mathrm{I}_{\mathrm{in}}=\frac{49}{5} \mathrm{~V}_{1}$

$$
\begin{align*}
& \Rightarrow \mathrm{V}_{1}=\frac{70}{49} \mathrm{I}_{\text {in }} \ldots \ldots . .(1) \\
& \therefore \mathrm{V}_{\text {out }}=2\left(\mathrm{I}_{\text {in }}-\frac{16 \mathrm{~V}_{1}}{5}\right) \ldots \ldots \tag{2}
\end{align*}
$$

Substitute equation (1) in equation (2)

$$
\begin{aligned}
\begin{aligned}
\mathrm{V}_{\text {out }} & =2\left(\mathrm{I}_{\text {in }}-\frac{16}{5} \times \frac{70}{49} \mathrm{I}_{\text {in }}\right) \\

Sol: The current "I" = ?

By superposition theorem, treating one independent source at a time.
(a) When 1A current source is acting alone.

Since the bridge is balanced; $\mathrm{I}_{1}=0 \mathrm{~A}$
(b) When 1 V voltage source is acting alone

$$
\mathrm{I}_{2}=0 \mathrm{~A}
$$

Since the bridge is balanced.
(c) When 2 V voltage source is acting alone and apply Reciprocity theorem, interchange source 2 volt and $1 \Omega$ positions.
$\frac{\text { Excitation }}{\text { Response }}=$ same

$\mathrm{I}_{3}=\frac{2}{3}=0.66 \mathrm{~A}$
By superposition theorem; $\mathrm{I}=\mathrm{I}_{1}+\mathrm{I}_{2}+\mathrm{I}_{3}$
$\mathrm{I}=0+0+0.66 \mathrm{~A}$
$\mathrm{I}=0.66 \mathrm{~A}$
02.

Sol:

By super position theorem; treating only one independent source at a time
(a) When 10 V voltage source is acting alone

By KVL $\Rightarrow$

$$
\begin{aligned}
& 10-2 i_{x 1}-i_{x 1}-2 i_{x 1}=0 \\
& i_{x 1}=2 A
\end{aligned}
$$

(b) When 3 A current source is acting alone

By Nodal $\Rightarrow$
$\frac{\mathrm{V}}{2}-3+\frac{\left(\mathrm{V}-2 \mathrm{i}_{\mathrm{x} 2}\right)}{1}=0$
$3 \mathrm{~V}-4 \mathrm{i}_{\mathrm{x} 2}=6$
And
$\mathrm{i}_{\mathrm{x} 2}=\frac{0-\mathrm{V}}{2} \Rightarrow \mathrm{~V}=-2 \mathrm{i}_{\mathrm{x}}$
Put (2) in (1), we get
$\mathrm{i}_{\mathrm{x} 2}=-\frac{3}{5} \mathrm{~A}$
By SPT ;
$\mathrm{i}_{\mathrm{x}}=\mathrm{i}_{\mathrm{x} 1}+\mathrm{i}_{\mathrm{x} 2}=2-\frac{3}{5}=\frac{7}{5}$

$\mathrm{V}_{\mathrm{L}}\left(0^{+}\right)=-\mathrm{V}\left(0^{+}\right)=-40 \mathrm{~V}=\left.\mathrm{V}_{\mathrm{L}}(\mathrm{t})\right|_{\mathrm{t}=0^{+}}$

## Observations:

$\mathrm{t}=0^{-}$
$\mathrm{t}=0^{+}$
$\mathrm{i}_{\mathrm{L}}\left(0^{-}\right)=2 \mathrm{~A}$

$\mathrm{V}_{\mathrm{L}}\left(0^{-}\right)=0 \mathrm{~V}$
$\mathrm{V}_{\mathrm{L}}\left(0^{+}\right)=-40 \mathrm{~V}$

## Conclusion:

To keep the same energy as $t=0^{-}$and to protect the KCL and KVL in the circuit (i.e., to ensure the stability of the network), the inductor voltage, the resistor current and its voltage can change instantaneously i.e., within zero time at $\mathrm{t}=0^{+}$.

$$

## Conclusion:

For all the source free circuits, $\mathrm{V}_{\mathrm{L}}(\mathrm{t})=-\mathrm{ve}$ for $t \geq 0$, since the inductor while acting as a temporary source (upto $5 \tau$ ), it discharges from positive terminal i.e., the current will flow from negative to positive terminals. (This is the must condition required for delivery, by Tellegan's theorem)
